

Planting Guide For Most Plants

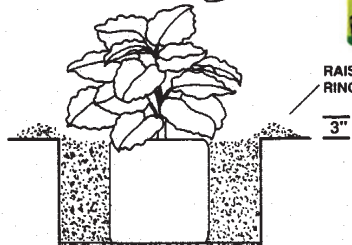

- Dig a planting hole at least 2X as wide and about the same height of the rootball to be planted.
- Create a **soil blend** by mixing 1 part soil, 1 part **Gardner & Bloome Planting Mix** and required amount of **Dr. Earth All Purpose Fertilizer** as per box instructions.

- Remove the container and open up tangled roots by scoring sides and bottom of rootball, then loosening by hand.
- Place plant so that the top of the rootball is level with or just slightly higher than the top of hole.

- Backfill planting hole with the **soil blend**, tamping it down as you go.

- Using your soil, create a 3" tall raised ring around the edge of the planting hole.

- Water thoroughly by filling the basin (area inside the raised ring) with a solution of **SUPERthrive** slowly 2 times. Repeat application in 1 week.

Basin inside raised ring

- Before watering again, check the soil moisture daily. Water **ONLY** if soil feels barely damp at a depth of 2 to 3 inches. Soil should be kept moist, not soggy. When watering, fill the basin slowly 2 times. This ensures a thorough watering and helps to leach harmful salts. After repeating this cycle several times, you will find the pattern of how often your plant needs to be watered.
